What the readings mean

0 - 15% Normal for a dry structure. Readings in this range are not recorded – only figures above 15% appear on this report.

15 - 20% A trace of moisture. Read against the other figures taken on this vehicle, and have the area checked again after three months.

20 - 30%	Moisture is entering the structure. The area should be investigated to establish how water is getting in, and resealed before the material degrades further.
----------	--

30% and above	High enough that the structure itself may already be damaged. Resealing is likely to be needed, followed by rectification of the damage without delay.
---------------	--

Comments and recommendations

Note These readings describe the vehicle on the day it was tested. Moisture content moves with the weather, and a dry figure today is no guarantee against damp appearing later. No liability is accepted for damp found after this date.

Testing covers the interior of the habitation area only.

Lockers and storage areas are tested as found. Belongings are not removed, so any surface they cover has not been read.
